Abstract of JP 10294922 (A)

PROBLEM TO BE SOLVED: To easily reserve and view a desired program by respectively storing the program chart information of digital satellite broadcasting and program information preserved on a tape and extracting and storing them by prescribed conditions. **SOLUTION:** The program chart information in digital signals outputted from a tuner 102 is extracted by a program chart information detection circuit 106 and stored in a first memory 302 through a microcomputer 301. The program information stored in a buffer memory 105 is stored in a second memory 303 through the microcomputer 301. By selecting an item from on-screen display, an instruction is supplied to the microcomputer 301 and only the one provided with a specified attribute (for instance, a category is a movie or the like) is selected from the program information in the memories 302 and 303 and stored in a third memory 304. The prepared list of programs is outputted to a video signal output terminal 208 as video signals by a display processing circuit 305.
